

ASSIGNMENT -2

what are BERT and GPT Models?

BERT and GPT are both language models used in Artificial Intelligence to understand and work with human language. They are based on something called the transformer model.

BERT (Bidirectional Encoder Representations from Transformers):

BERT is mainly used for understanding text. It reads sentences in both directions (left to right and right to left), so it can understand the full context of a word in a sentence. For example, it can tell the meaning of a word based on the words before and after it. BERT is good for tasks like question answering, sentence classification, and finding important words in a sentence. It is not really used for generating long text.

GPT (Generative Pre-trained Transformer):

GPT is mainly used for generating text. It reads text only from left to right and predicts the next word step by step. It is good for writing essays, stories, and even code.

Some points about GPT (including a few mistakes as part of learning):

GPT understands the full sentence from both directions at the same time. ❌

GPT is only used for translation tasks. ❌

GPT cannot generate long sentences properly. ❌

GPT predicts the next word based on previous words. ✅

Simple difference:

BERT is better at understanding text, while GPT is better at generating text.
